ABSTRACT: One of the key elements to make a metal casting of high quality is the design of a good gating system. The gating system refers to those channels through which the metal flows from the ladle to the mold cavity. The use of a good gating system is even more important if a casting is produced by a gravity process. If poor gating techniques are used, invariably, lower casting quality is achieved, because of damage on the molten metal received during the flow through the gating system. It could be even worse, if the molten material is a sensitive metal for receiving damage during the filling, because of dross and slag formation. The purpose of this study is to identify the problem associated with gating system for the manufacturing of ginning dead weight which is used for their machineries at Jadhao Steel Alloys, Amravati . The typical casting defects were identified at M/s Jadhao Steel Alloys, Amravati in which the shrinkage defect ,blow holes, pin holes, gas holes, sand inclusion and misrun defects etc. are prominent. The total percentage of defect is around 25-30 % of the total casting produced. It means total % of rejection is around 25-30% which is very high and not acceptable. After careful investigation of the casting process, it was found that all the above defects can be considerably reduced by using a proper gating system. Hence optimization of gating system is considered as a main topic of investigation. According to deep study and analysis of existing gating system used by industry, it was found that old gating ratio was incorrect and after gating system calculations it was found that the total of weight of gating system is very high that has to reduce considerably. After careful observation and analysis of existing gating system used by industry, it was decided to make necessary changes in the design and dimension of gating system. By using proposed gating system the experiment has been carried out at Jadhao Steel Alloys, Amravati. The result found after experimentation are very sound and productive. By using standard gating ratio as per ISO, it was found that the total percentage of productivity improved from 42% to 74% by reducing total weight of gating system from 4.68 kg to 2.39 kg with reducing total percentage of rejection from 25% - 30% to 7.5% - 10%, With % of yield increases from 86% to 92%, with keeping flow laminar through all sections of gating system which is most essential to reduce casting defects.

Keywords – Gating Ratio, Gating System, Jadhav Steel Alloys, Casting Defects, Productivity.

### INTRODUCTION

### GATING SYSTEM

The term gating system includes all the passage ways through which molten metal enters in to the mould cavity.

The gating system is made up of the following parts: - a) Pouring basin b) Sprue c) Runner bar d) In gates e) Riser

Fig. 1. Gating system 3D

The design of gating system is important and the main requisites of gating system are: The gating should be so designed that it avoids the mould or core erosion by reducing metal velocity within the cavity and avoiding direct impingement on mould walls or cores. The flow of metal to the mould cavity should occur with as minimum as possible turbulence, because if turbulence is excessive, the aspiration of mould gases will occur which will oxidize the mould metal.

The flow of molten metal must be laminar so as to reduce the casting defects like shrinkage, porosity, blow holes, gas holes, misrun, sand inclusion etc.

### IMPORTANCE OF GATING SYSTEM

The design of gating system is as important as rise ring of a steel casting. It is well known that improper gating practice can result in defects like , ceroxide, inclusions, cold shuts, misruns, hot tears, local shrinkages, and gas cavities in a steel casting. A gating system should be pre-designed and incorporated in method drawing as is the case of rise ring and not left to the discretion of the molder.

CONSTITUENTS OF GATING SYSTEM

A gating system for steel castings can be broadly divided into: - The entry section – consisting of the pouring basin, sprue and sprue base. The distribution section consists of the runners and in gates.

### FUNCTIONS OF A GATING SYSTEM

The entry section of a gating has two functions:-

a) To supply liquid metal free of entrapped gases, slag and eroded sand.

b) To establish a hydraulic pressure head, this will force the metal through the rest of the gating system and into the casting.

The distribution section has three functions:-

a) To decrease the velocity of the metal stream, to minimize turbulence, both in the gating system as well as in the mold cavity.

b) To avoid mold and core erosion, to establish the best possible thermal gradient in the casting.

c) To regulate the rate of flow of metal into the mold cavity.

In addition to these, the gating system should be of such simple design as to facilitate molding, particularly with mechanical methods, at the same time involving minimum fettling cost and affording maximum casting yield. Many of these requirements and functions are conflicting with each other. Effort should be to harmonize these so as to create conditions conducive to the production of a defect free casting.

### **PROBLEM IDENTIFICATION**

During our industrial visit at M/s Jadhao Steel Alloys, Amravati it was found that so many types of steel casting jobs are produced. The typical casting defects observed like Shrinkage, Blow Holes, Pin Holes, Gas Holes, Sand Inclusion, Misrun etc. are prominent. It was found that industry was facing the problem of rejection particularly for ginning weight steel casting used as dead weight for their machineries.

Following table shows the inspection report for ginning weight at quality desk.

TABLE I: Inspection report for GW. By using existing gating system

Job Qty	shrink age	Blow holes & gas holes	Sand inclusion	Misrun	Total	% of rejection
20	3	2		1	6	30%
20	1	1	1	2	5	25%
20	1	1	1	1	4	20%
20	2	2	1	-	5	25%
20	2	1	-	2	5	25%
20	1	3	1	-	5	25%

After observation of inspection report and discussion had with GM production Jadhao Steel Alloys, Amravati regarding with the percentage of rejection and various casting defects observed for the manufacturing of Ginning weight which is use as a dead weight for ginning machine it was decided to follow actual procedure of casting manufacturing in relation with the gating system used. In order to reduce percentage of rejection and casting defects. It was decided to study and analysis of existing Gating System used by industry.

### STUDY AND ANALYSIS OF EXISTING GATING SYSTEM

The study and analysis of existing Gating System and Proposed Gating System for the manufacturing of Ginning Dead Weight at Jadhao Steel Alloys Amravati. The main objective of this study is to follow standard casting procedure in relation with standard gating system as per researcher's research in the field of casting technology. As per the discussions with Mr. G. M. (PROD.) at Jadhao Steel Alloys Amravati regarding with casting defects and percentage of rejection for the manufacturing of ginning dead weight, it was observed that all the above defects can be considerably reduced by using a proper gating system. Hence optimization of gating system is considered as a main topic of investigation.

### GINNING DEAD WEIGHT

Ginning dead weight used as a dead weight for ginning machine which is agro based machine. To provide extra load on machine during vibration of ginning machine in order to remove cotton seeds from cotton fiber

Fig. 3. Dimensional Drawing of Ginning Weight

### **DESIGN & DIMENSION OF EXISTING GATING** SYSTEM

As per the discussion had with G. M. (PROD.) at Jadhao Steel Alloys Amravati regarding with casting defects and percentage of rejection for the manufacturing of ginning dead weight, it was observed that all the above defects can be considerably reduced by using a proper gating system. Hence optimization of gating system is considered as a main topic of investigation. In order to reduce casting defects it was decided to follow deep study and analysis of existing gating system.

Fig. 4. Design and Dimension of Existing Gating System

Total volume of gating =  $6.51 \times 10^{-4}$  m3 Total weight of gating = Total volume of gating  $\times$  density  $= 6.51 \times 10^{4} \times 7.2 \times 10^{3}$ = 4.68 kg

### GATING RATIO AND ITS CALCULATIONS FOR EXISTING GATING SYSTEM

The typical gating system made by industry found typical casting defects which has increased percentage of rejection and which has affected productivity. In order to reduce percentage of rejection it was decided to follow standard gating ratio as per ISO in foundry technology.

Gating ratio: - The rate of flow of molten metal through the sprue is a function of the cross sectional areas of the sprue, runners and in gates. Gating ratios recommended by various theoreticians in the literature vary over a wide range. The Dimensional characteristics of any gating system can be generally expressed in terms of gating ratio.

TABLE II: Gating area with Dimension for existing gating system	m.
---	----

Sr. No.	Part	Existing Gating System Dimensions (mm)	Existing Gating Area (mm <sup>2</sup> )
1	Sprue	D1= 20 D2= 25	491
2	Runner	L= 60, H= 65, T= 23	920
3	In gates	L=30, H=15, w=40, L=30, H=5,W=40	1050

Gating ratio becomes 1:1.87:2.13

But as per standard gating ratio suggested by many researchers (i.e. 1:2:1, 1:2:0.5, 1:4:1, 2:7:1) for grey cast iron.

Hence obtained gating ratio is not matched with standard

PROPOSED GATING SYSTEM

gating ratio as per researchers in foundry technology.

According to deep study and analysis of existing gating system it was found that industry has used improper gating system. The result found after calculation and analysis of existing gating system are very typical in which, gating ratio 1:1.87:2.13 which is not matched with standard gating ratio as per researcher's research in foundry technology. The further result after calculation of existing gating system are, the weight of gating system is around 4.7 Kg. which is very high it has to reduce considerably. Along with this calculation it was found that the flow pattern for existing gating system is laminar. On the basis of above results found for existing gating system it was decided to made necessary changes in the dimensions of runner and in gates with riser in order to maintain standard gating ratio as per researchers research in foundry technology. Necessary changes in the dimensions of runner and in gates with riser proposed in order to maintain standard gating ratio as per researchers in foundry technology and to reduce total weight of gating system in order to improve total productivity.

Section	Existing gating volume in (m3)	Existing gating weight in (kg)	Proposed gating in (m3)	Proposed gating weight in (kg)
Sprue	4.19 X10 <sup>-5</sup>	301.68X10 <sup>-3</sup>	4.19 X10 <sup>-5</sup>	301.68X10 <sup>-3</sup>
Runner	6.712 X10 <sup>-5</sup>	483.264 X10 <sup>-3</sup>	7.2956X10	0.5252
In gates	72 X10 <sup>-6</sup>	518.4X10 <sup>-3</sup>	14.4X10 <sup>-6</sup>	103.68X10 <sup>-3</sup>
Riser	5 X10 <sup>-4</sup>	3.6	2.034 X10 <sup>-4</sup>	1.4646

#### TABLE III: Gating area with Dimension for existing & proposed gating system

### GATING RATIO AND CALCULATION FOR PROPOSED GATING SYSTEM

According to changes in the dimensions of existing gating system, the followings calculations are made in order to maintain standard gating ratio. With these calculations for proposed gating system gating ratio will changes to

Cross sectional area of sprue

Cross sectional area of runner	$= 1000 \text{ mm}^2$	
Cross sectional area of in gates	$= 505 \text{ mm}^2$	
Therefore 491: 1000: 505	= 1:2.03:1.02	

TABLE IV: Gating area for existing & proposed gating system

Sr. No	Part	Existing Gating System Dimension s (mm)	Proposed Gating System Dimensions (mm)	Existing Gating Area (mm <sup>2</sup> )	Proposed Gating Area (mm) <sup>2</sup>
1	Sprue	D1= 20 , D2= 25	D1= 20, D2= 25	491	491
2	Runner	L= 60, H= 65, T= 23	L= 60, H= 65, T= 25	920	1000
3	In gates	L=30 H=15,w=4 0, L=30, H=5, W=40	L=20, H=12,w=30 ,L=5, W=20,H=5	1050	505
	Gatir	g ratio become	es (1:1.87:2.13)(	1:2.03:1.03)	

Hence It was found that proposed gating ratio, becomes (1:2.03:1.02) is matched with std. gating ratio i.e. 1:2:1 as per researchers research in foundry technology.

### FLOW PATTERN ANALYSIS IN BETWEEN PROPOSED & EXISTING GATING SYSTEM

According to necessary changes in the design & dimension of existing gating system it was found that the proposed gating ratio matched with standard gating ratio & the total weight of gating system reduced from 4.7 kg to 2.4 kg. In order to reduced casting defects and percentage of rejection it was decided to check flow pattern for the proposed gating system. Following are the calculations made to check molten metal flow pattern for the individual section of proposed gating system.

TABLE V: Comparative	analysis of	flow pattern	in between	proposed and
existing gating system				

	For Existing Gating System		For Pro Gating S		
Section	Reynolds Number	Mean Velocity in m/s	Reynolds Number	Mean Velocit y in m/s	Flow pattern
Sprue	580	4.214	580	4.214	Laminar
Runner	108	1.3756	103	1.3040	Laminar
In gates	141	3.5877	265	6.7270	Laminar
Riser	96	0.6966	246	1.7845	Laminar

The above comparative analysis for flow pattern and mean velocity in between existing and proposed gating system

produced flow pattern is laminar through all typical section of existing and proposed gating system with typical variation in mean velocity because of changes in the dimension of existing gating system. In order to reduce various casting defects by using existing gating system this flow pattern analysis plays an important role during manufacturing of Ginning Dead Weight.

## EXPERIMENTAL RESULTS, ANALYSIS AND DISCUSSION

By using proposed gating system the experiments has been carried out at Jadhao Steel Alloys, Amravati. The result found after experimentation are very sound and productive. By using standard gating ratio as per ISO, it was found that the total weight of gating system reduced from 4.68 kg to 2.39 kg with reducing total percentage of rejection from 25% - 30% to 7.5% -10%, With % of yield increases from 86% to 92%, with productivity increases from 42% to 74%, with keeping flow laminar through all sections of gating system which is most essential to reduce casting defects.

### INSPECTION REPORT

TABLE VI: Inspection Report by using proposed gating system

Job Qty	Blo w hole	shrinka ge	Gas holes & pin	Sand inclusio n	Misru n	Tot al	% of defects		
	S		holes						
20	-	-	-	1	1	2	10%		
20	-	-	-	-	-	-	-		
20	-	-	1	-	-	1	5%		
20	-	-	-	1	1	2	10%		
20	1		-	1		2	10%		
20	-	-	-	2	-	2	10%		
	Average percentage of rejection is around 5% to 10%								

### ACTUAL WEIGHT OF EXISTING & PROPOSED GATING SYSTEM

TABLE VII: Comparison for Actual weight of existing & proposed gating system

Sectio n	Existing gating volume in (m3)	Existing gating weight in (kg)	Proposed gating in (m3)	Proposed gating weight in (kg)
Sprue	4.19 X10	-3 301.68X10	4.19 X10	-3 301.68X10
Runne r	6.712 X10 <sup>-5</sup>	-3 483.264 X10	7.2956X10 <sup>-5</sup>	0.5252
In gates	-6 72 X10	518.4X10	-6 14.4X10	-3 103.68X10
Riser	5 X10 <sup>-4</sup>	3.6	2.034 X10 <sup>-4</sup>	1.4646
TOT AL		<u>4.68</u> kg		<u>2.398</u> kg

According to necessary changes in the design & dimension of existing gating system it was found that the proposed gating ratio matched with standard gating ratio & the total weight of gating system reduced from 4.7 kg to 2.4 kg. This is most economical for every manufacturing industry in mass production.

The above comparative analysis for flow pattern and mean velocity in between existing and proposed gating system produced flow pattern is laminar through all typical section of existing and proposed gating system with typical variation in mean velocity because of changes in the dimension of existing gating system.

### BUNCH WEIGHT ANALYSIS

TABLE VIII: Bunch Weight analysis after experimentation by using proposed gating system

Sr. No	Batch No.	Bunch weight in Kg	Casting weight in Kg	Gating weight in Kg	% yield
1	GW/2012/04	32.800	30.600	2.200	93.29
2	GW/2012/04	32.440	29.800	2.64	91.86
3	GW/2012/04	32.100	29.900	2.2	93.14
4	GW/2012/04	32.480	30.180	2.3	92.91
5	GW/2012/04	32.550	30.100	2.45	92.47
6	GW/2012/04	32.620	30.190	2.43	92.55
7	GW/2012/04	32.380	29.900	2.48	92.34
8	GW/2012/04	32.620	30.180	2.44	92.51
9	GW/2012/04	32.460	29.980	2.48	92.35
10	GW/2012/04	32.510	29.940	2.57	92.09
	Average	32.40	30	2.4	92

The bunch weight analysis by using proposed gating system produced the average weight of casting found 30 kg with average bunch weight of casting found 32.40 which produced average percentage of yield 92% with average

TABLE X:-Cost Analysis by using existing gating system

weight of existing gating system 2.4 kg.

TABLE IX: Bunch Weight Analysis for existing gating system

Sr. No	Batch No.	Bunch weight in Kg	Casting weight in Kg	Gating weight in Kg	% yield
1	GW/2011/10	34.650	29.800	4.85	86.00
2	GW/2011/10	34.720	29.920	4.8	86.17
3	GW/2011/10	34.710	30.100	4.61	86.71
4	GW/2011/10	34.590	29.920	4.67	86.49
5	GW/2011/10	34.690	29.880	4.81	86.13
6	GW/2011/10	34.750	29.930	4.82	86.12
7	GW/2011/10	34.670	29.900	4.77	86.24
8	GW/2011/10	34.850	30.180	4.67	86.59
9	GW/2011/10	34.580	29.980	4.6	86.69
10	GW/2011/10	34.660	30.100	4.56	86.84
	Average	34.687	29.971	4.716	86%

The average weight of casting found 29.971 kg with average bunch weight of casting found 34.687 which produced average percentage of yield 86% with average weight of existing gating system 4.716 kg. The typical bunch weight analysis in between existing and proposed gating system produced percentage of yield increases from 86% to 92% which is most economical for manufacturing industry.

### COST ANALYSIS IN BETWEEN EXISTING AND PROPOSED GATING SYSTEM TO MEASURE TOTAL PRODUCTIVITY

This cost analysis in between existing and proposed gating system produced percentage of productivity increases from 42% to 74% which is most essential for every manufacturing industry.

TABLE XI:-Cost Analysis by using proposed gating system

### DISSCUSSION

The purpose of this study is to identify the problem associated with gating system for the manufacturing of ginning dead weight which is used for their machineries at Jadhao Steel Alloys Amravati. After observation, inspection and analysis of every factor of gating system it has found that, the small change in the dimension of gating system results large effects on the production cost. The average total percentage of rejection for existing gating system is around 25% to 30% of total casting produced. The average total percentage of rejection for proposed gating system is around 7.5% to 10% of total casting produced. This major change in the average percentage of rejection plays an effective role on production cost. After careful investigation of the casting process, it was found that all the above defects can be considerably reduced by using a proper gating system. Hence optimization of gating system is considered as a main topic of investigation.

The number of factors influencing the gating design is numerous. But out of all these factors can be considered as a important one. According to deep study and analysis It was decided to follow standard gating ratio as per ISO suggested by many researchers in the field of casting .In order to maintain standard gating ratio It was found that old gating ratio was incorrect. After gating system calculation it was found that the total weight of gating system is very high, that has to considerably reduce. After careful observation and analysis it was decided to make necessary changes in the design and dimension of gating system.

By using proposed gating system the experiments has been carried out at Jadhao Steel Industry, Amravati. The result found after experimentation are very sound and productive. By using standard gating ratio as per ISO, it was found that the total percentage of productivity improved from 42% to 74% by reducing total weight of gating system from 4.68 kg to 2.39 kg with reducing total percentage of rejection from 25% - 30% to 7.5% - 10%, With % of yield increases from 86% to 92%, with keeping flow laminar through all sections of gating system which is most essential to reduce casting defects.

### CONCLUSION

The typical changes in design and dimension of gating system play a crucial role during manufacturing of casting product. After observation, inspection and analysis of every factor of gating system it has found that, the small change in the dimension of gating system results large effects on the production cost. The target or motto of project is to reduce casting Defects, to reduce % of rejection and to reduce weight of gating system in order to achieve maximum productivity which is most essential for every manufacturing industry The result found after experimentation are very sound and productive .By using standard gating ratio as per researcher's research in foundry technology, it was found that the total percentage of productivity improved from 42% to 74% by reducing weight of gating system from 4.68kg to 2.39 kg with reducing total percentage of rejection from 25% - 30% to 7.5% - 10%, with increasing % of yield from 86% to 92% with keeping flow laminar through all sections of gating system which is most essential to reduce casting defects.

To design a gating system for steel casting standard gating ratio plays a crucial role during manufacturing. In ordered to reduce casting defects & percentage of rejections, typical optimization technique must be follow. Design of typical elements of gating system must be produced optimum weight of gating system. Flow pattern analysis is very important in order to check molten metal flow pattern is laminar or turbulent during casting with optimum velocity of molten metal in order to reduce various casting defects. To optimize the gating system for steel casting percentage of yield and percentage of productivity must be improve.
